

BIL462 – Artificial Neural Networks

Artificial Neural Networks (Image-Based) Project

Final Project Topic and Group Members Notification

Project Name: Car Model Recognition Using Deep Learning

Group Name: Junkers

Project Description:

This project aims to build a deep learning model that classifies car make and model from a single photograph. Using the Stanford Cars Dataset (196 classes, 16,000+ images)((we are not sure about this dataset, but currently we are planning to use this)), we will apply transfer learning with a pre-trained CNN (ResNet or EfficientNet) and fine-tune it for car recognition or build a image-classifier model from scratch. The final model will be able to identify the car model from a photo taken with a phone camera in real time (real-time is goal but we are not promising on that).

Project Team Members

	Student No	Group Member (Name and Surname)
1	Y23LBIM801	Hasan Tatar
2	200029887	Kağan Çavuşoğlu
3	200031033	Umut Gökmen
4	200026932	Cenk Yarım
